New Release

We proudly announce the release of EIDORS version 3.9, for the 18th Int. Conf. on Biomedical Applications of EIT, in June 2017. The software is available at eidors.org and licensed under the GNU GPLv2 or GPLv3. Archived versions are now available on Zenodo [1] (and v3.8 [2]).

EIDORS aims to provide free software algorithms for forward modelling and inverse solutions of Electrical Impedance and (to some extent) Diffusion-based Optical Tomography, in medical, industrial and geophysical settings and to share data and promote collaboration.

New Features

Release 3.9 of EIDORS builds upon a strong foundation in reconstruction algorithms, adding and improving a number of aspects.

- Faster forward solve times for real conductivity distributions
- Improved support for GREIT reconstructions in 3D [3]
- New hyperparameter selection approaches [4]
- Interface to “Regularization Toolbox” [5]
- Gmsh-based human 3D model interface [3]
- Correction of artefacts caused by low frame rates [6]
- Improved support for mixed point and CEM electrode models
- Support for 2.5D solvers (including a rank-1 2.5D movement Jacobian) [7]
- Forward solve supporting model reduction (i.e. efficient precalculation of out-of-field regions) [8]
- Improved testing framework esp. for core solver algs
- Improved support for geophysical FEM models
- Improved support for Octave
- Updated ability to load recent device file formats including auxiliary data (Dräger and Swisstom formats)
- Expanded shape library

Growth

EIDORS-related citations continue to grow. Current citation results are shown in the following table. The EIDORS code-base is growing (See figure below.) with significant effort being applied to improving test coverage, refining performance and implementing new features. In 2012, a dev (development) staging area was created for contributions in progress.

Reference

Discussion

The structure of EIDORS has been relatively stable due, in part, to some early design choices: a modular framework and data structure, cross-platform support, integration of meshing, tutorials, and the contributed data repository. These aspects, along with an open source code-base, have enabled EIDORS to maintain research relevance. Presenting version 3.9!
