Why Monitor Lung Perfusion?

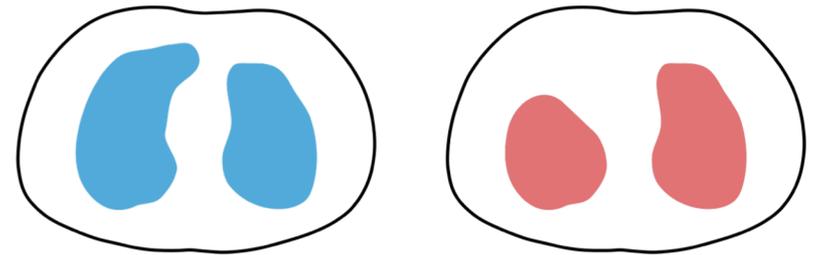

- Pulmonary embolisms are notoriously challenging to diagnose and monitor
- Mainly diagnosed using CT pulmonary angiography
 - Associated with radiation exposure and invasive administration of a contrast agent
- Clinical need to improve diagnosis and monitoring
 - Safe and low-cost method with few false positives

Perfusion/Ventilation Monitoring

Perfusion/Ventilation match

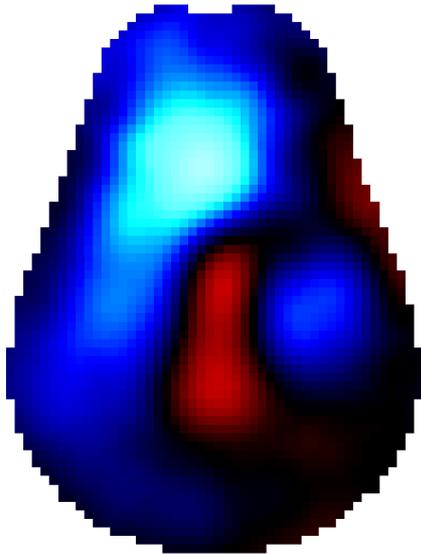

Perfusion/Ventilation mismatch

Sample sketches represent ventilation and perfusion in a human thorax

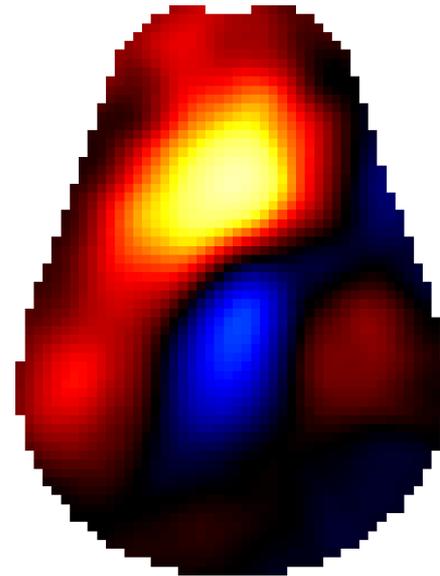

Ventilation

- Validated and reasonably well understood

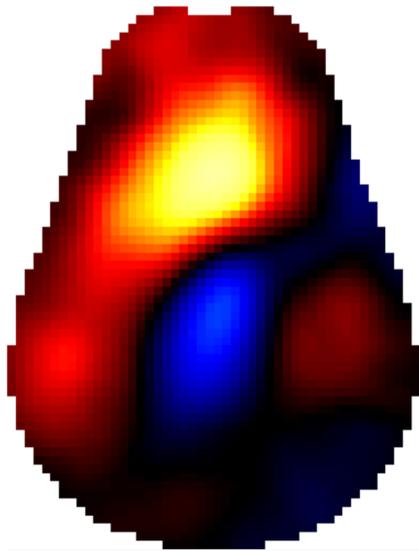

Perfusion

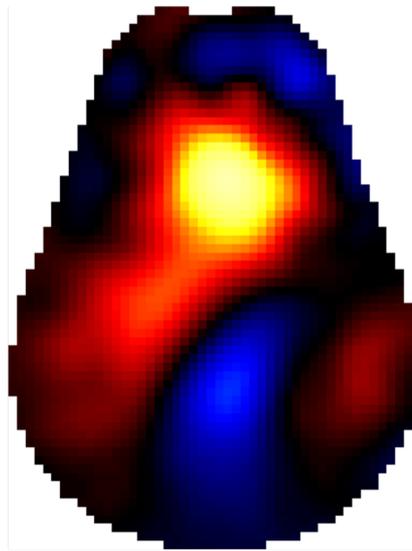

- Less understood and validated

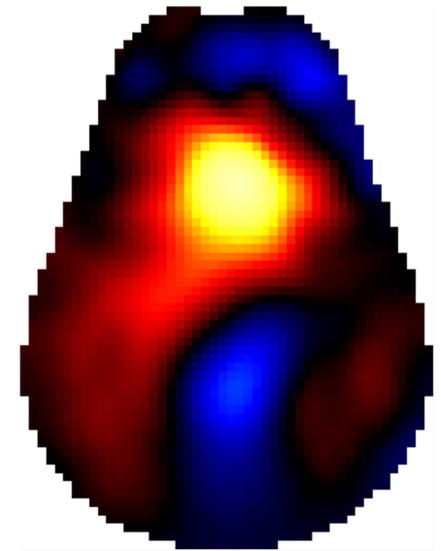

Perfusion Monitoring Techniques

Bolus Injection

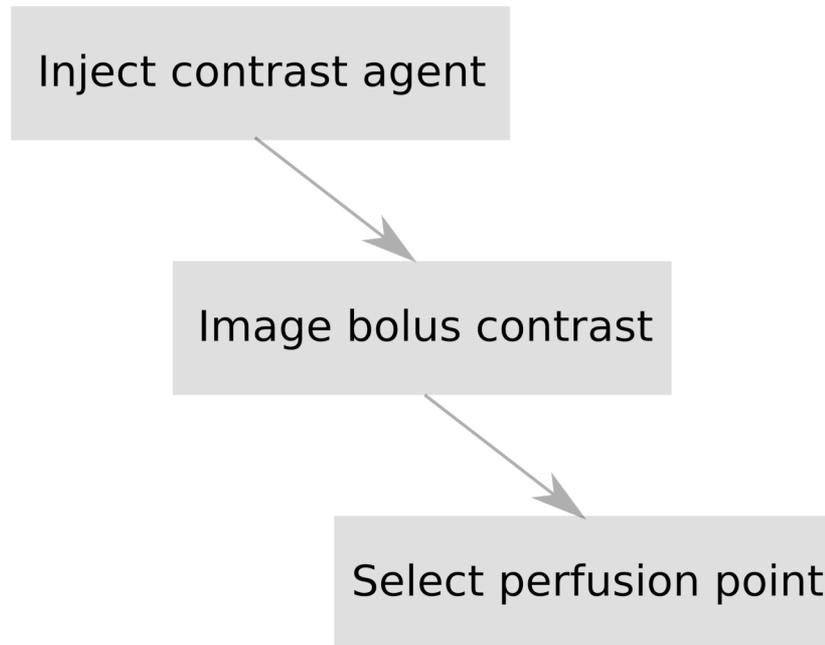

Ventilation Filtering

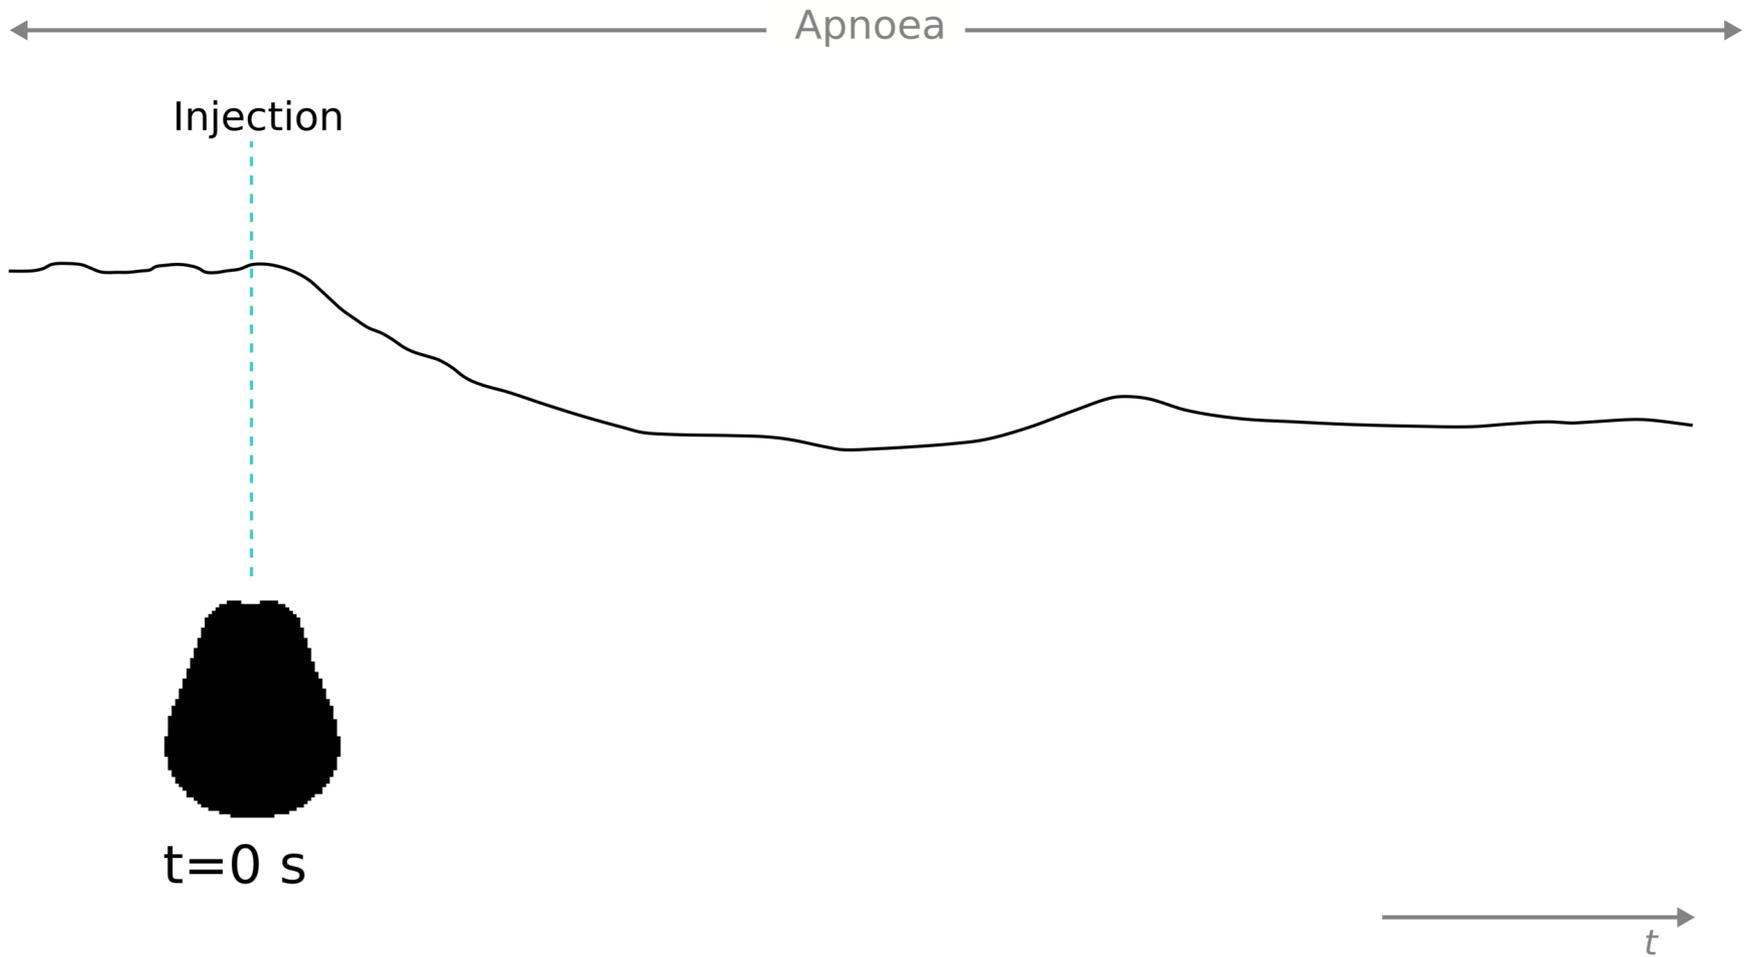

Apnoea Filtering

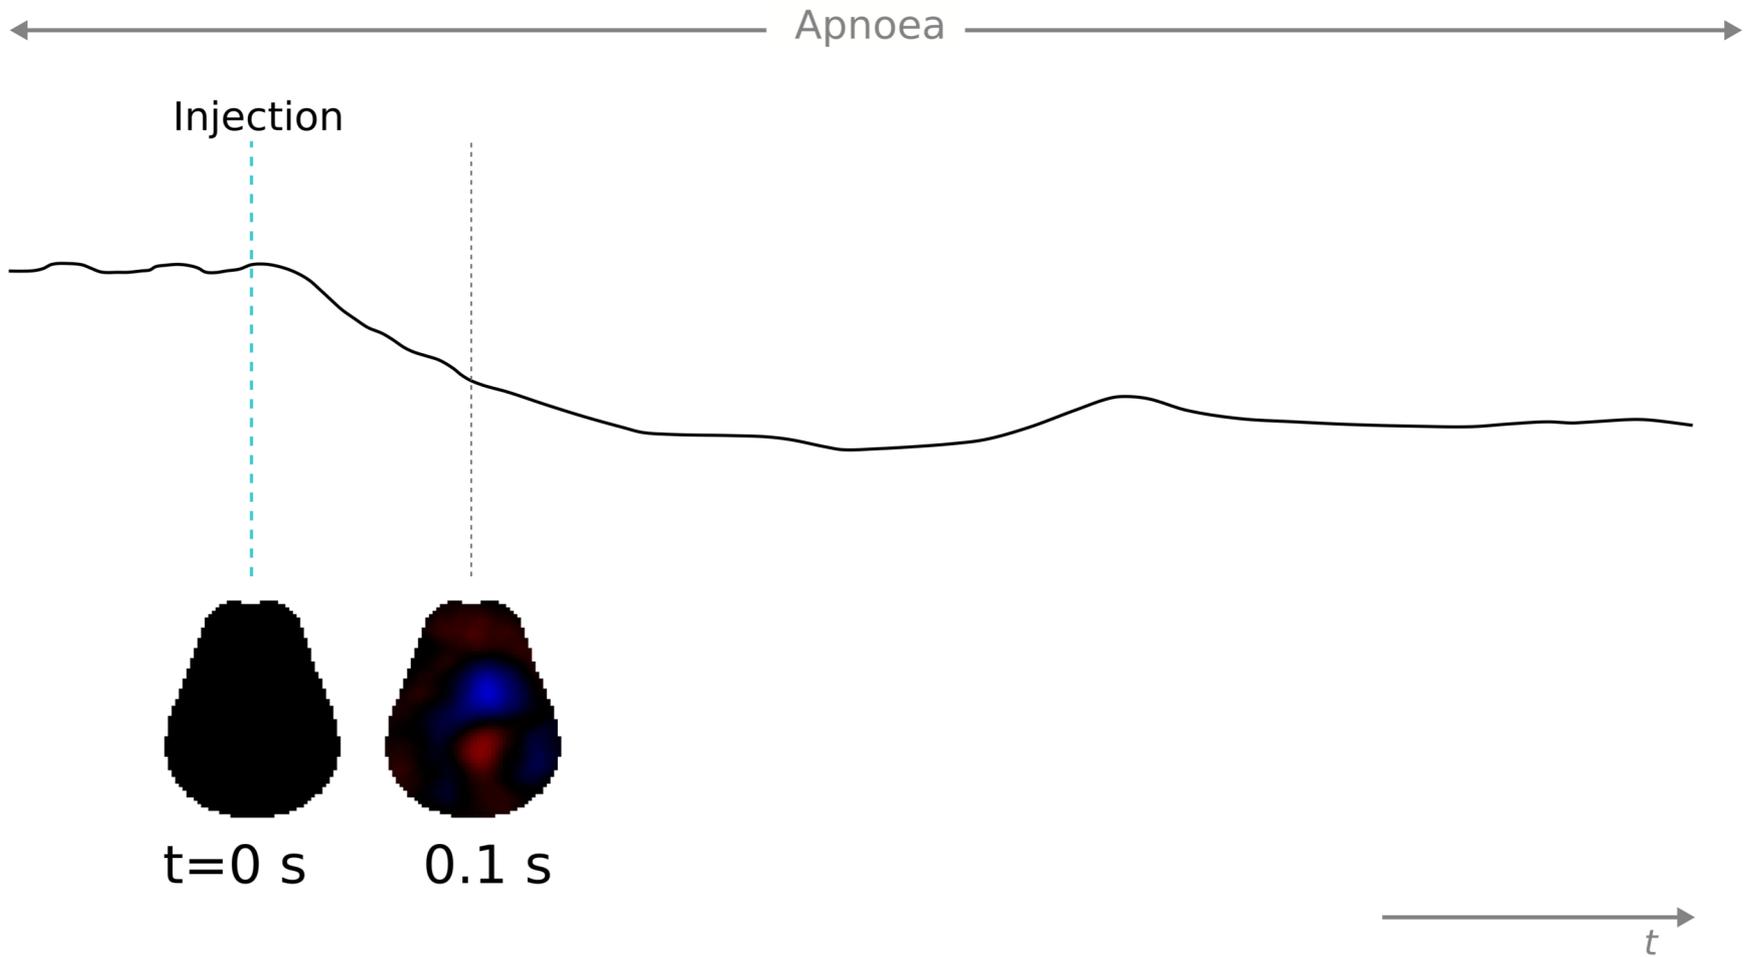

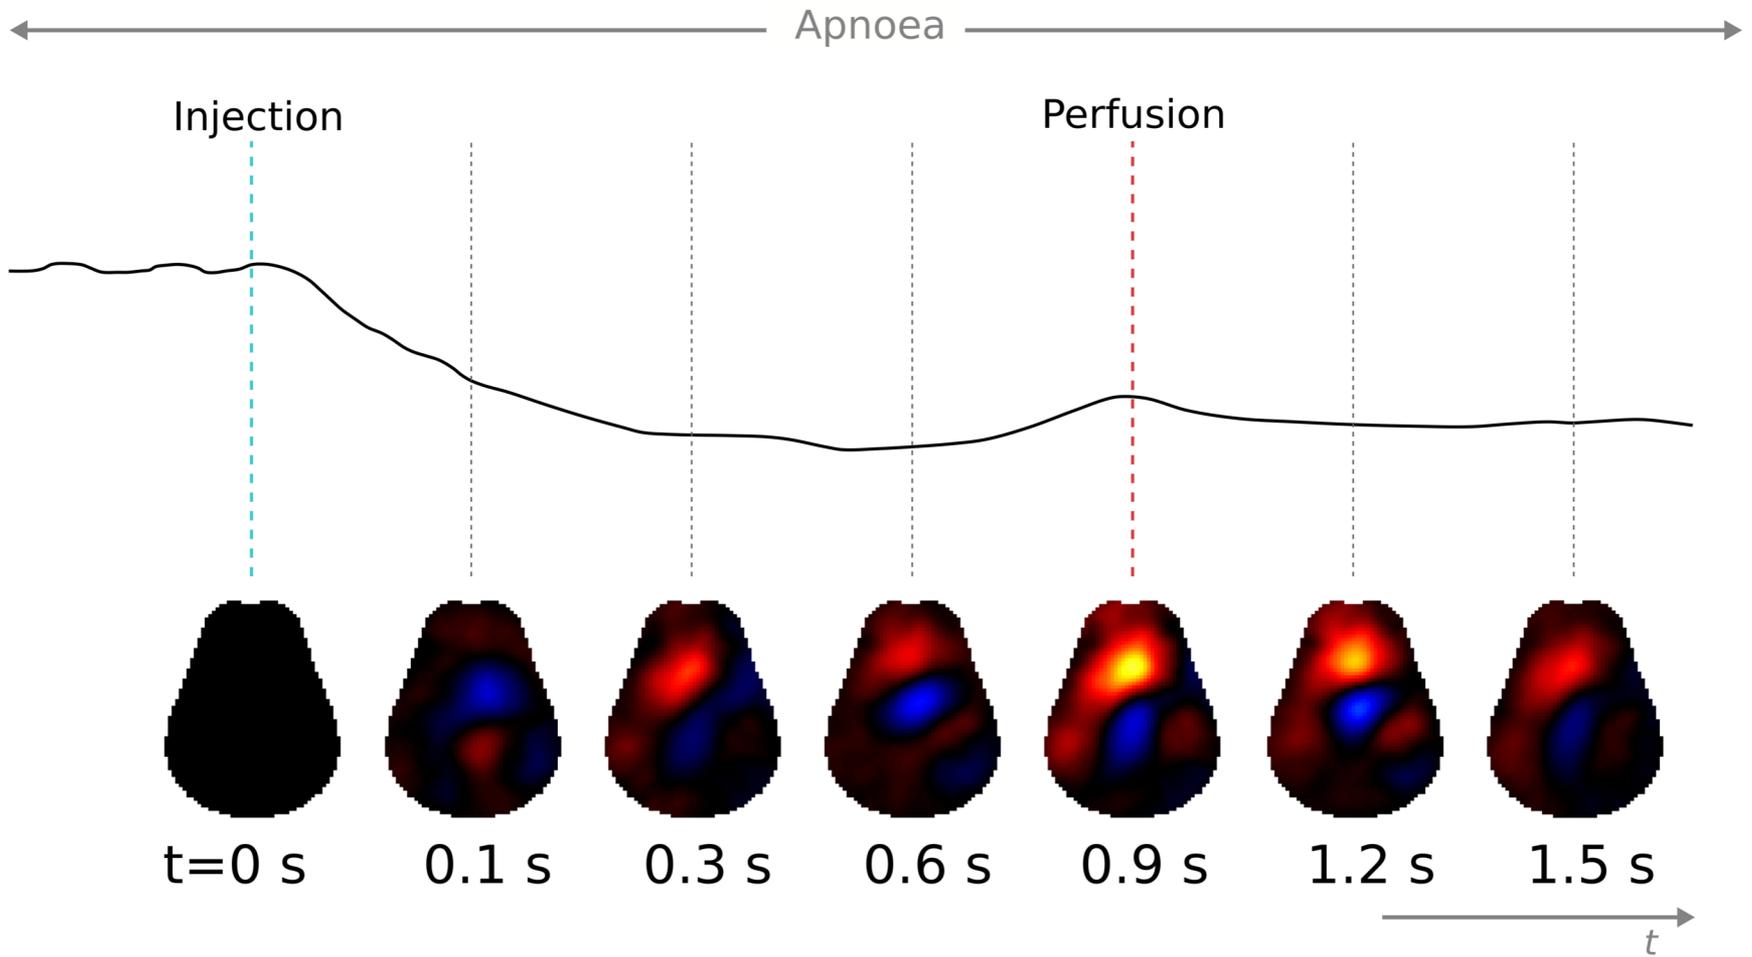

Contrast agent measures of perfusion

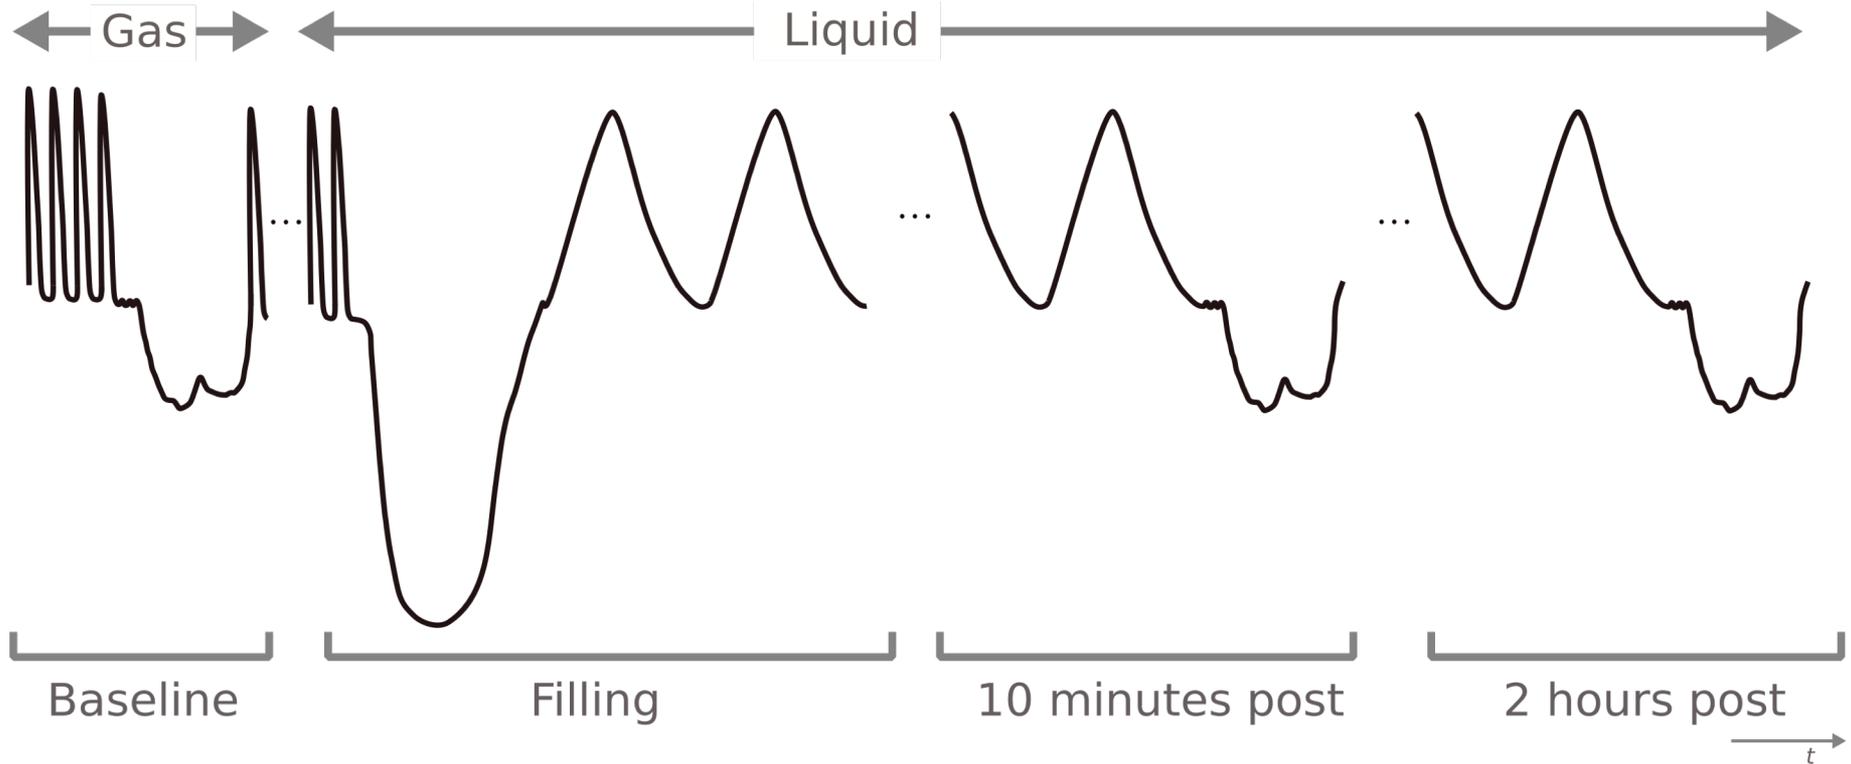

- Requires apnoea
- Non-continuous
- Invasive
- Can be performed a limited number of times
- Provides a series of blood flow images

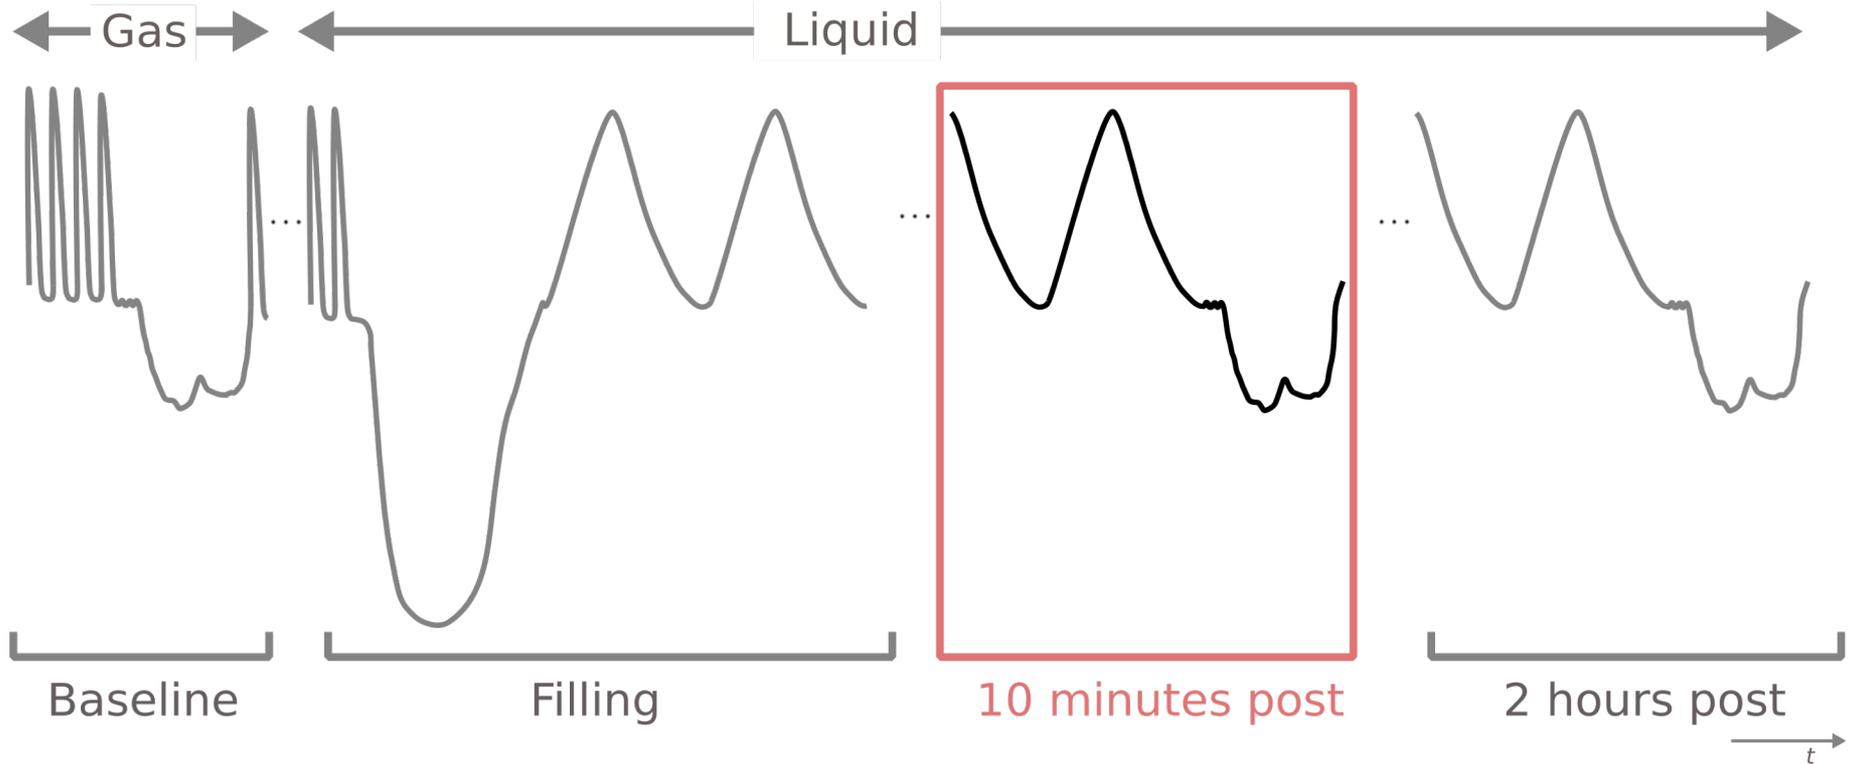

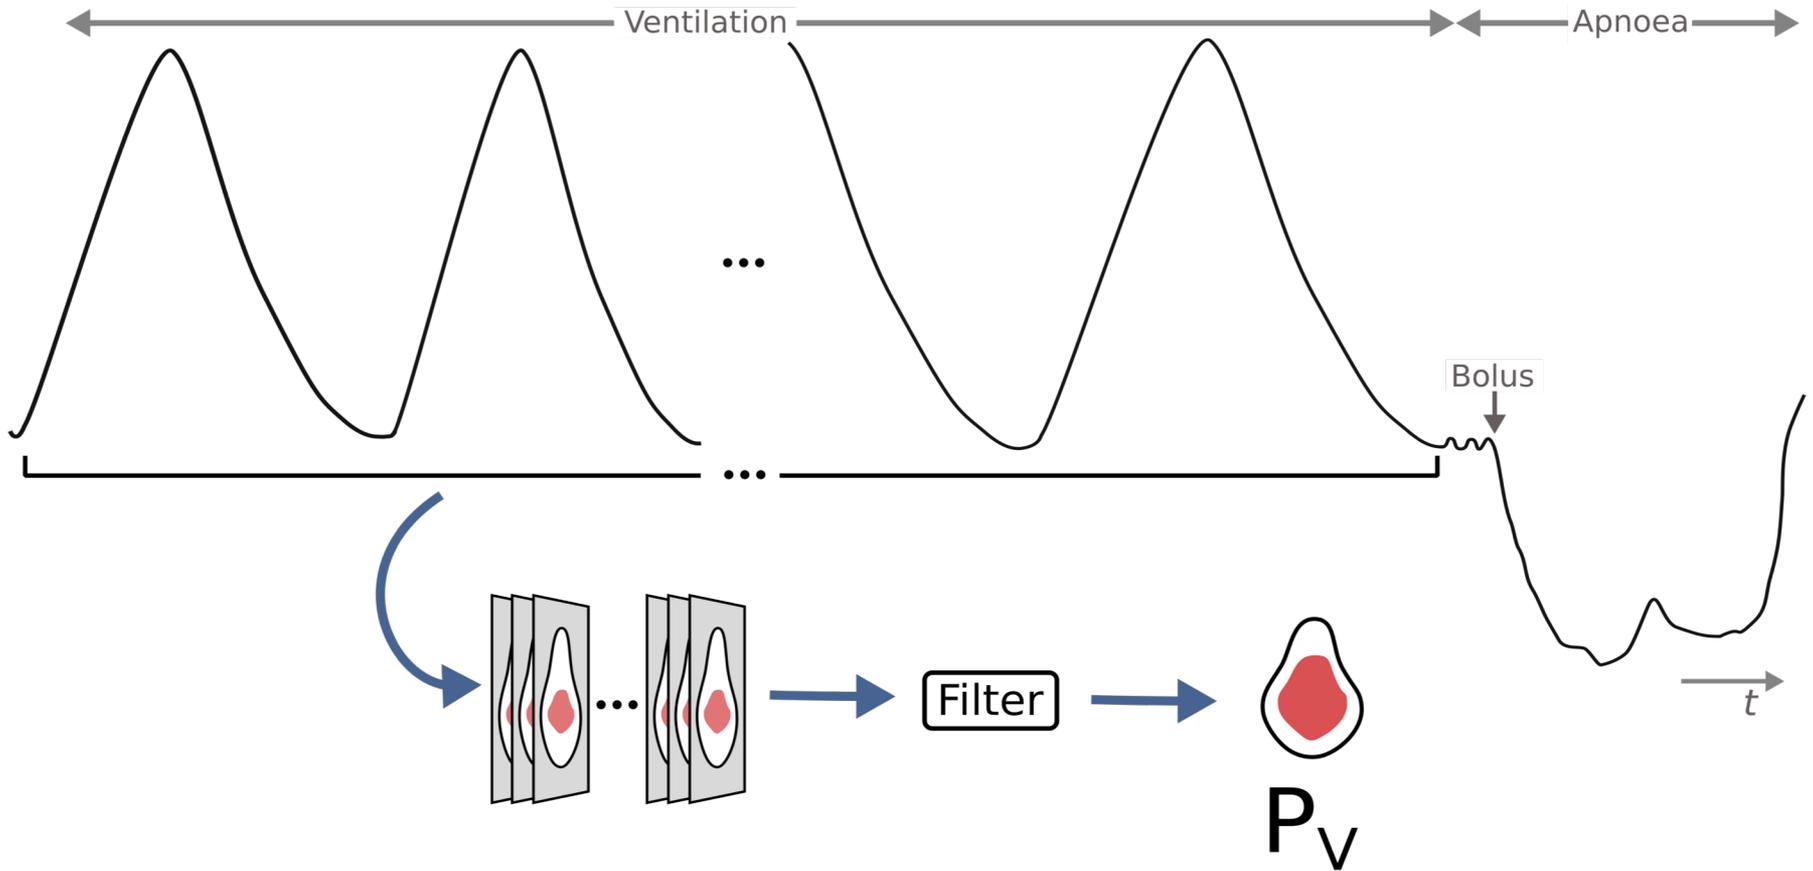

Experimental Protocol

Experimental Protocol

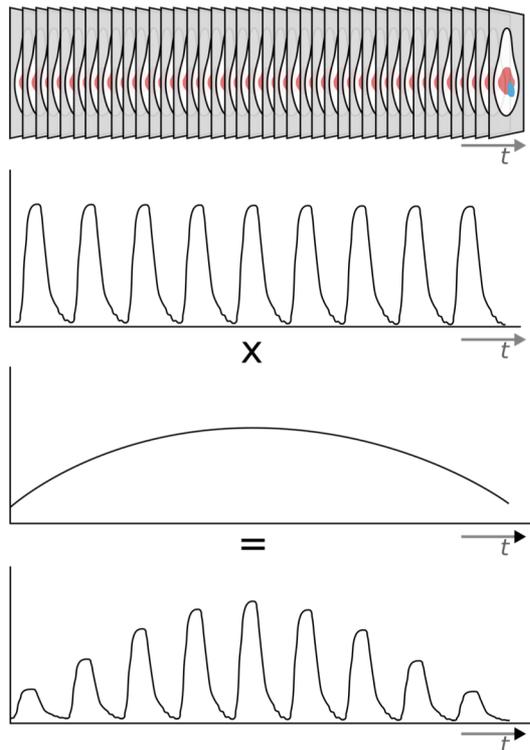

Pulsatility Analysis

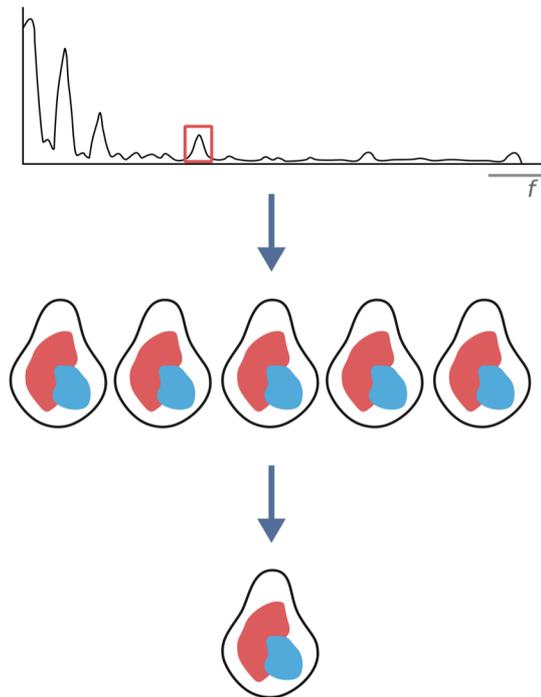

Frequency filtering technique

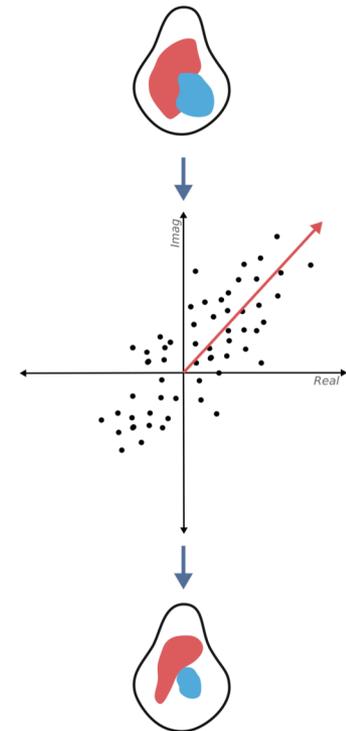

Time Domain

Frequency Domain

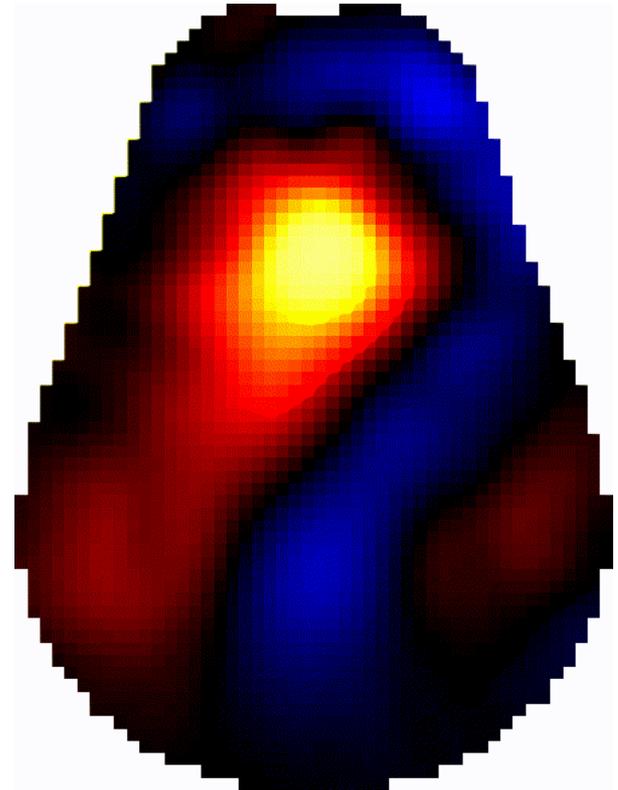

Phase Alignment

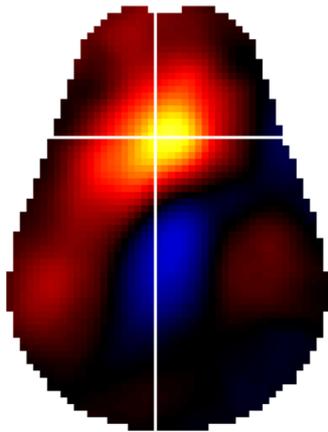

Shortcomings of Pulsatility

- Heart rate is unstable over time
- Many pixels throughout the image are out of phase
- Events at the heart rate frequency are not limited to perfusion

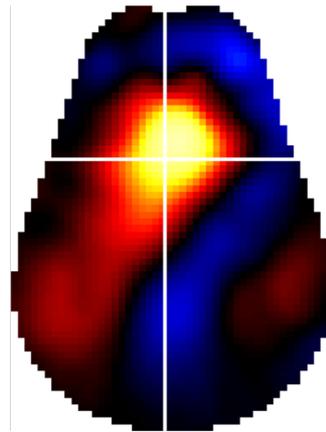

Conclusion

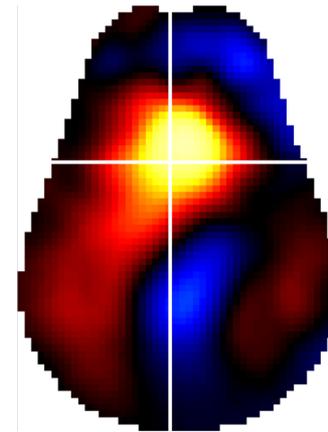

- Many challenges accurately estimating perfusion from pulsatility
- Preliminary analysis shows correlation between the three methods of perfusion measures
 - Comparing both center of mass and overall shape
